Own Your Health

Restorative Medicine

Restorative Medicine is a healthcare framework that aims to restore normal functions in the body by creating the optimal supportive environment to **assist homeostasis**. It works to strengthen and rebalance systems that may be under stress. The goal is **long term improvement**, not temporary relief.

When you combine restorative medicine with **true ownership**; then healthcare ceases to be something delivered to us from the outside only.

Restorative Medicine

JAS Foundation Courses

Fascia

Hydration

Self Care

Practitioners List

Instead, it becomes an internal, self-directed process of **listening, responding, and optimizing**. It bridges the gap between what the body inherently knows how to do and how we **consciously support that process**.

Restorative medicine **bridges** the border between patient and practitioner. The **practitioner** becomes a **facilitator**, a **guide**, and an **educator**, and the patient reclaims their agency as the **primary steward** of their **own health** and well-being.

Taking responsibility and ownership of our health requires us to:

- Honour the **Body's Intelligence**: The body is wired to self-heal, self-regulate, and find balance. Learn to: **tune** into the subtle language of the nervous system (interoception awareness); **recognise** signs of stress, misalignment, or ease; and trust that inner feedback.
- Shift from Suppressing to **Supporting**: Instead of focusing on managing symptoms; find the underlying **root cause(s)**. Ask: What does my body need to restore its natural flow? How can I activate my parasympathetic nervous system, release physical tension, restore alignment, or give my body the right fuel/food to restore health. The goal is to create the optimal conditions and environment for the body to do its work.
- Make all Tools of Wellness **accessible**: To make effective healing modalities accessible and affordable by offering training and setting up local infrastructure. JAS Foundation is currently working towards this by offering Bowen courses and establishing local clinics. When individuals and communities are equipped with both, restorative and conventional medical options; then wellness and health becomes a shared, lived reality for all, rather than a luxury.
- Recognise the **Power of the Micro-Shift**: Small subtle precise movements – a quiet pause, a gentle physical release, or a conscious shift in environment – can reset the entire system, creating a massive ripple effect throughout the whole body.

JAS Foundation Courses

Knowledge Shared Empowers

JAS Foundation training programs courses are in full swing!

We are running two courses during 2026, the Bowen Practitioners course and the Bowen Advance course. The course curriculums are designed to give trainees **knowledge, skills** and **practical experience**.

Next Generation of Practitioners

The 2026 Cohort are the second group of trainees doing the Bowen Practitioner course. The seven trainees completed 7 of the 10 Modules required by the JAS Foundation. They come from communities across Cape Town, namely, Belhar, Elsies River, Hanover Park, Manenberg, Mandalay, Nyanga, and Ottery. Watching them dive into the foundations of bodywork and healthcare has been incredibly inspiring.

Taking It to the next Level

JAS Foundation launched its first Bowen Advance Course in 2026. Three graduates from the 2025 Cohort, successfully applied for and are participating in the Advance course. The Advance curriculum allows practitioners to deepen their theoretical understanding, sharpen clinical skills, and mentor the 2026 Cohort trainees.

"Teaching is not filling a vessel, but **kindling a flame."**

We are grateful for our **passionate trainees, dedicated mentors,** and the **supportive community** making these programmes possible!

Fascia

Matrix linking our whole body

Microscopic Fascia Structures

Fascia is a **continuous, three-dimensional web** of flexible **connective tissue** that wraps around and weaves **through every** muscle, bone, nerve, blood vessel, and internal organ **in the human body**. Rather than functioning as separate, isolated components, organs and muscles are **linked together by this unifying matrix**.

Core Functions of Fascia

1. Proprioception and Interoception

Fascia is one of our **primary sensory organs**; providing the central nervous system with constant real-time feedback regarding spatial awareness, balance, tension, and internal physical state. Fascia is **heavily innervated with sensory nerve endings**.

2. Structural Tensegrity and Force Transmission

Fascia **distributes mechanical loads across the entire body** rather than concentrating force on isolated joints. Up to **30–40% of the force generated by a muscle is transmitted through its surrounding fascial network** rather than its tendon alone.

3. Fluid Movement and Metabolic Exchange

Healthy fascia is rich in hyaluronan (hyaluronic acid) and extracellular fluid, creating a **lubricated environment that enables adjacent tissue layers to slide against one another without friction**. This fluid matrix **also facilitates nutrient transport and lymphatic drainage**.

4. Nociception and Pain Dynamics

When fascia becomes **dehydrated, inflamed, or subjected to chronic stress**, hyaluronan thicken and become viscous. This leads to **fascial adhesions or restrictions**. Because deep fascia contains **high densities of nociceptors**; fascial tightness or **micro-inflammation causes chronic musculoskeletal pain and altered movement patterns**.

LOCAL PATTERNS & RESTRICTIONS

Maintaining Healthy Fascial Systems

- **Movement:** varied movement **hydrates fascial layers and prevents adhesion formation**.
- **Hydration and Electrolytes:** Adequate hydration maintains the **gel-like fluid state of the extracellular matrix**.
- **Targeted Manual Therapy and Mechanical Stimulation:** Light touch, sustained pressure, or targeted movement modalities **stimulate mechanoreceptors, promoting tissue glide and autonomic relaxation**.

Hydration

Water - Liquid Gold

Thirst is a delayed physiological reaction: by the time you consciously **feel thirsty**, your body is **already** mildly **dehydrated**,

Water makes up roughly **60%** of human body weight and is **essential** for virtually every system to **function** properly.

When thinking about healing, we often focus on nutrition, rest, or specific therapies. But **water** is the **literal environment** where all **healing** takes place. Every chemical reaction, cellular repair, and detoxification process in the human body **requires fluid to function**.

When you are **dehydrated**, the body **shifts** from a state of optimal regeneration to a **state of conservation**—thereby **slowing down** processes to **repair tissues** and **balance** the **nervous system**.

Health Benefits

- **Brain and Cognitive Function:** Even **mild dehydration** (1–2% loss of body weight in fluid) **impairs** concentration, short-term **memory**, **mood**, and **reaction** times while increasing the frequency of **headaches**.
- **Joint Lubrication and Cushioning:** Cartilage found in joints and spine discs contains about **80% water**. **Proper** hydration **maintains** fluid **cushioning**, **reducing friction** and long-term **joint pain**.
- **Cardio-vascular Efficiency:** Water **maintains blood volume**, allowing the **heart** to **pump blood** more **easily** throughout the body, and **reducing strain** on the cardiovascular system.
- **Temperature Regulation:** Sweat **cools** the body through evaporation. Being well-hydrated **ensures** your body can release heat efficiently during physical exertion or hot weather.
- **Digestive Health and Kidney Function:** Water **helps** with regular **bowel** movement, keeps the stool soft, and help the **kidneys** to **filter waste** products from the blood; preventing kidney stones and urinary tract infections.
- **Physical Performance:** Hydration **preserves** volume of the muscle cell, **delays** fatigue, and helps **prevent** muscle cramps during exercise.

Sources of hydration

- Water is the **best**. Water-rich foods like fruit and vegetables also work to hydrate you.

"You become biltong if you are not adequately hydrated,
and biltong cannot relax."

The concept of water memory was popularized by Japanese researcher **Masaru Emoto**, who claimed that water can **record** vibrations of **emotions** and **thoughts**.

According to his experiments, water molecules **change** their **structure** when exposed to human words, music, or even intentions. ... He argued that samples exposed to positive words such as "love" and "gratitude" formed harmonious and beautiful crystals, while those exposed to negative words such as "hate" and "fear" showed chaotic and deformed structures. ... Emoto's experiments have permeated the popular imagination, influencing disciplines such as alternative medicine and emotional well-being.

The words we use creates the homes our soul lives in.
